Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

EP 0 631 176 B1

Description

[0001] This invention relates to photothermographic materials and in particular to stabilisers and antifoggants for use therein.

[0002] Heat-developable photosensitive materials which can produce photographic images using a dry heat processing method (referred to herein as "photothermographic materials") are known and described for example, in US Patent Nos. 3152904 and 3457075 and in "Thermally Processed Silver Systems" by D. Morgan and B. Shely, "Imaging Processes and Materials", Neblettes's Eighth edition; Edited by J.M. Sturge, V. Walworth and A. Shepp, p.2 (1969). Such photothermographic materials have a photosensitive medium comprising a reducible silver source, e.g. an organic silver salt; a catalytic amount of photocatalyst, e.g., silver halide, in reactive association with the reducible silver source, and a reducing agent for silver ion, ordinarily dispersed in an (organic) binder matrix. Although stable at ambient temperatures, when heated to higher temperatures, e.g., 80°C, or higher, after imagewise exposure, silver is produced in the exposed regions of the medium via a redox reaction between the reducible silver source and the reducing agent. This redox reaction is accelerated by the catalytic action of the exposure-generated silver catalyst. The silver provides a black image which contrasts with the unexposed areas, resulting in the formation of an image.

[0003] In practice, it is essential to include an effective antifoggant in such photothermographic materials, since without an antifoggant, some generation of silver in the unexposed areas takes place upon thermal development, resulting in a poor differential between image and background fog. In addition, one of the problems of photothermographic materials involves their post-processing stability. Since the process is performed without a fixing step, it is desirable to provide a means to enable room light handling of the final image.

[0004] Polybrominated organic compounds have been described as both antifoggants and image-stabilisers for photothermographic materials since they can oxidise reduced silver (fog) back to silver bromide under thermal (anti-fog-gant) and light exposed (image stabiliser) conditions.

[0005] Examples of such compounds are described in US 4,546,075, US 4,452,885 (tribromomethylheterocycles as anti-foggants), US 3874946 (tribromomethylsulphonylaromatics as image stabilisers) and EP-A-0600587 (tribromomethylketones).

[0006] Due to the thermal processing of the photothermographic imaging material, all the compounds used in the construction of the material will be present in the final image sheet. All the materials included in such a material must be acceptable both environmentally and in their possible effect on those persons who might come into contact with the material. The materials must be determined to be non-mutagenic and also it is highly desirable that they do not sensitise the skin of those who come in contact with them. Many polybrominated organic compounds are known to be powerful skin irritants and sensitisers and it is desirable to find compounds having effective anti-foggant and image stability properties for photothermographic materials which exhibit acceptably low sensitisation to human skin.

[0007] EP-A-605981 discloses compounds of the formula:

in which;

R represents a hydrogen atom, an alkyl group, an aryl group or a heterocyclic group, any of which groups may be substituted.

[0008] This small class of compounds are effective antifoggants and image stabilizers in photothermographic materials and exhibit low skin sensitisation. The latter property is particularly surprising since other compounds of similar structure have proved positive in skin sensitisation tests.

[0009] The present invention provides a further class of polybromo organic molecules which are suitable for use as image stabilizers and antifoggants in photothermographic materials and exhibit acceptably low sensitisation of human skin and guinea-pigs.

[0010] According to the present invention there is provided a compound having a nucleus of the formula:

[0011] The compounds of the invention generally have the formula:

[0012] The ring substituents R may be the same or different and selected from any of those groups well known in organic chemistry.

[0013] Each R is generally selected from hydrogen, alkyl groups comprising up to 10 carbon atoms, preferably up to 5 carbon atoms; aryl groups comprising up to 14 carbon atoms, preferably up to 10 carbon atoms; 5, 6, 7 or 8-membered heterocyclic ring nuclei and heterocyclic fused ring nuclei comprising up to 14 ring atoms, halogen atoms (e.g., fluorine, chlorine, bromine and iodine), a hydroxy group, alkoxy groups (e.g., methoxy, ethoxy), aryloxy groups (e.g., phenoxy, hydroxyphenoxy), amino groups (e.g., amino, methylamino, dimethylamino), a cyano group, acylamino groups (e.g., acetylamino, benzoylamino), diacylamino groups (e.g., succinimido), ureido groups (e.g., methylureido), sulphonamido groups (e.g., methylsulphonamido), acyloxy groups (e.g., acetyloxy), sulphamoyl groups (e.g., N-ethylsulphamoyl), alkylcarbonyl groups, arylcarbonyl groups, alkoxy carbonyl groups (e.g., methoxycarbonyl, ethoxycarbonyl), aryloxy carbonyl groups (e.g., phenoxycarbonyl), alkoxy carbonyl amino groups (e.g., ethoxycarbonylamino), hydroxy-alkyl groups (e.g., hydroxyethyl, hydroxypropyl), alkoxyalkyl groups (e.g., methoxyethyl, methoxypropyl), mercapto groups, alkylthio groups, arylthio groups, alkylsulphonyl groups, arylsulphonyl groups, acyl groups, aralkyl groups, alkyl groups containing a carboxyl group (e.g., carboxymethyl, carboxyethyl), each of which groups may where appropriate comprise up to 14 carbon atoms, preferably not more than 10 carbon atoms.

[0014] Examples of ring and fused ring nuclei represented by R include: isoxazole, pyrimidine, quinoxaline, indole, indole and tetraazindene.

[0015] Examples of alkyl groups represented by R include: methyl, ethyl, propyl, isopropyl, butyl, isobutyl, t-butyl, pentyl, isopentyl, hexyl, octyl etc.

[0016] Examples of aryl groups represented by R include: phenyl, ethoxyphenyl, tolyl, xylyl, naphthyl etc.

[0017] As is well understood in this technical area, a large degree of substitution is not only tolerated, but is often advisable. As a means of simplifying the discussion, the terms "nucleus", "group" and "moiety" are used to differentiate between chemical species that allow for substitution or which may be substituted and those which do not or may not be so substituted. For example, the phrase "alkyl group" is intended to include not only pure hydrocarbon alkyl chains, such as methyl, ethyl, octyl, cyclohexyl, iso-octyl, t-butyl and the like, but also alkyl chains bearing conventional substituents known in the art, such as hydroxyl, alkoxy, phenyl, halogen (F, Cl, Br and I), cyano, nitro and amino. The term "nucleus" is likewise considered to allow for substitution. Thus, the phrase "pyrimidine nucleus" would be understood to include not only an unsubstituted pyrimidine ring, but also pyrimidine rings bearing conventional substituents known in the art. The phrase "alkyl moiety" on the other hand is limited to the inclusion of only pure hydrocarbon alkyl chains, such as methyl, ethyl, propyl, cyclohexyl, iso-octyl and t-butyl.

[0018] The invention also relates to photothermographic elements comprising light-sensitive silver halide in reactive association with a reducible silver compound, a reducing agent capable of reducing the silver compound to metallic silver, and, as an antifoggant, a compound of the invention as defined above.

[0019] Conventional silver halide photothermographic chemistry is used in the materials of the invention. Such chemistry is described in, e.g., U.S. Patent Nos. 3,457,075, 3,839,049, 3,985,565, 4,022,617 and 4,460,681. Any of the various photothermographic media, such as full soaps, partial soaps, and the like may be used in the practice of the

present invention, including both black-and-white and color chemistries and either *in situ* halidised (e.g., as disclosed in U.S. Patent No. 3457075) or preformed silver halide sources (e.g., as disclosed in U.S. Patent No. 3839049) may be used.

[0020] Conventional photothermographic chemistry comprises a photosensitive silver halide catalyst, a silver compound capable of being reduced to form a metallic silver image (e.g., silver salts, both organic and inorganic, and silver complexes, usually light-insensitive silver materials), a developing agent for silver ion (a mild reducing agent for silver ion) and a binder.

[0021] The photothermographic chemistry may be black and white or colour-forming. In the latter type of material, the reducing agent generates a colour on oxidation, either by becoming coloured itself, or by releasing a dye during the process of oxidation. Any leuco dye capable of being oxidized by silver ion to form a visible dye is useful in the practice of the present invention. Dye-forming developers such as those disclosed in U.S. Patent Nos. 3,445,234, 4,021,240, 4,022,617, 4,368,247 and 4,460,681 are useful, and also those disclosed in Japanese Patent Publication No. 82-500352, and likewise dye-releasing developers, such as those disclosed in US 4,981,775.

[0022] The compounds of the invention may be incorporated into the photothermographic medium in the same manner as antifoggants of the prior art. The optimum concentration for individual compounds of the invention may vary widely. In some cases, starting from the minimum amount required to suppress fog, increasing the amount of the tribromomethyl sulphone compound leads to a loss of image density, but in other cases it may produce an increase in image density before levelling out. In general, the compounds of the invention are utilised in amounts of from about 1×10^{-3} to about 1×10^{-1} moles per mole of silver, although amounts outside this range may also be useful.

[0023] In addition to the compounds of the invention, the photothermographic media of the invention may also contain, as a speed enhancing agent, a heterocyclic ring compound of the type disclosed in US Patent No. 5,028,523 in which a nitrogen atom of the ring is electrically balanced by hydrobromic acid and which is associated with a pair of bromine atoms. The central nucleus of the nitrogen-containing heterocyclic compound may be generally represented by any of the following formulae:

in which;

Q represents the atoms (preferably selected from C, S, N, Se and O, more preferably C, N and O) necessary to complete a 5-, 6-, or 7-membered heterocyclic ring (monocyclic) or fused ring nucleus (polycyclic, especially bicyclic, with a fused-on benzene ring). The heterocyclic nucleus may possess one or more substituents selected from those defined for groups represented by R. Exemplary and preferred heterocyclic ring groups include pyridine, pyrrolidone and pyrrolidinone. Other useful heterocyclic ring nuclei include pyrocyclic rings, e.g., pyrrolidines, phthalazinone and phthalazine.

[0024] Preferred heterocyclic nuclei for use in the practice of the present invention may be defined by the formulae:

in which;

n is 0 (zero) or has integral values of from 1 to 4, and each R^5 represents a substituent selected from those defined for groups represented by R, e.g., alkyl groups, alkoxy groups, aryl groups, nitro and cyano. Substituents on adjacent positions may form fused ring groups so that formula (i) above would in fact be inclusive of formulae (ii) and (iv).

[0025] These compounds are generally used in an amount of at least 0.005 moles/mole of silver. Usually the range is from 0.005 to 1.0 moles of the compound per mole of silver and preferably between 0.01 and 0.3 moles per mole of silver. The preferred level is currently about 0.01 moles/mole silver.

[0026] The preferred nitrogen-containing heterocyclic compound is pyridinium hydrobromide perbromide (PHP).

[0027] Photothermographic materials are usually constructed as one or two imaging layers on a substrate. Single layer constructions must contain the reducible silver source, the silver halide and the developer, as well as optional additional materials, such as toners, coating aids and other adjuvants. Two-layer constructions must contain the reducible silver source and silver halide in one layer (usually the layer adjacent the substrate) and the other ingredients in the second layer or both layers.

[0028] The silver halide may be any photosensitive silver halide, such as silver chloride, silver bromide, silver iodide, silver chlorobromide, silver bromiodide, silver chlorobromiodide etc., and may be added to the imaging layer in any fashion which places it in catalytic proximity to the reducible silver source. The silver halide generally comprises from 0.75 to 15% by weight of the imaging layer, although larger amounts of up to about 25% by weight, are also useful. It is preferred to use from 1 to 10% by weight silver halide in the layer, more preferably from 1.5 to 7%. The silver halide may be prepared *in situ* by conversion of a portion of silver soap by reaction with halide ions or it may be preformed and added during soap generation, or a combination of both methods may be used. The latter is preferred.

[0029] The silver halide may be sensitised to visible or infrared light by means of the appropriate dyes, which may be added to the mixture of silver halide and reducible silver salt, or when preformed silver halide is employed, spectral sensitisation may be carried out prior to mixing with the reducible silver salt, as described in US Patent No. 4,476,220. Spectral sensitising dyes for use in photothermographic media are well known in the art, and include cyanine dyes and merocyanine dyes as disclosed, for example, in US Patents Nos. 3,761,279, 3,719,495, 3,877,943 and 4,835,096, and European Patent No. 127,455. A preferred class of infrared sensitising dyes is disclosed in EP-A-0614014.

[0030] The reducible silver source may comprise any material which contains a reducible source of silver ions. Silver salts of organic and hetero-organic acids, particularly long chain fatty carboxylic acids (comprising from 10 to 30, preferably 15 to 25 carbon atoms), are preferred. Complexes of organic or inorganic silver salts in which the ligand has a gross stability constant for silver ion of between 4.0 and 10.0 are also useful.

[0031] Examples of suitable silver salts are disclosed in Research Disclosure Nos. 17029 and 29963 and include: salts of organic acids, e.g., gallic acid, oxalic acid behenic acid, stearic acid, palmitic acid, lauric acid and the like; silver carboxyalkylthiourea salts, e.g., 1-(3-carboxypropyl)thiourea and 1-(3-carboxypropyl)-3,3-dimethylthiourea; complexes of silver with the polymeric reaction product of an aldehyde with a hydroxy-substituted aromatic carboxylic acid, e.g., aldehydes, such as formaldehyde, acetaldehyde and butyraldehyde, and hydroxy-substituted acids, such as salicylic acid, benzilic acid, 3,5-dihydroxybenzilic acid and 5,5-thiodisalicylic acid, silver salts or complexes of thiones, e.g., 3-(2-carboxyethyl)-4-hydroxymethyl-4-thiazoline-2-thione and 3-carboxymethyl-4-thiazoline-2-thione complexes or salts of silver with nitrogen acids selected from imidazole, pyrazole, urazole, 1,2,4-triazole and 1H-tetrazole, 3-amino-5-benzylthio-1,2,4-triazole and benzotriazole; silver salts of saccharin, 5-chlorosalicylaldoxime; and silver salts of mercaptides.

[0032] The preferred silver source is silver behenate.

[0033] The reducible silver source generally comprises from 5 to 70%, preferably from 7 to 45% by weight of the imaging layer. The use of a second imaging layer in a two-layer construction does not affect the percentage of the silver source.

[0034] The reducing agent for silver ion may be any material, although organic materials are preferred which will reduce silver ion to metallic silver. Conventional photographic developers such as phenidone, hydroquinones and catechol are useful, but hindered phenol reducing agents are preferred. The reducing agent generally comprises from 1 to 10% by weight of the imaging layer, but in a two-layer construction, if the reducing agent is in the layer separate from that containing the reducible silver source, slightly higher proportions, e.g., from 2 to 15%, tend to be more desirable. Colour photothermographic materials, such as those disclosed in US Patent No. 4460681, are also contemplated in the practice of the present invention.

[0035] Examples of suitable reducing agents are disclosed in US Patent Nos. 3770448, 3773512 and 3593863 and Research Disclosure Nos. 17029 and 29963, and include aminohydroxycycloalkenone compounds, e.g., 2-hydroxypiperidino-2-cyclohexenone; esters of amino reductones as developing agent precursors, e.g., piperidino hexose reductone monoacetate; N-hydroxyurea derivatives, e.g., N-p-methylphenyl-N-hydroxyurea; hydrazones of aldehydes and ketones, e.g., anthracene aldehyde phenylhydrazone; phosphoramidophenols; phosphoramidoanilines; polyhydroxybenzenes, e.g., hydroquinone, t-butyl-hydroquinone, isopropylhydroquinone and (2,5-dihydroxyphenyl)methylsulfone; sulphydroxamic acids, e.g., benzenesulphydroxamic acid; sulfonamidoanilines, e.g., 4-(N-methanesulfonamido)aniline; 2-tetrazolylthiohydroquinones, e.g., 2-methyl-5-(1-phenyl-5-tetrazolylthio)hydroquinone; tetrahydroquinoxalones, e.g., 1,2,3,4,-tetrahydroquinoxaline; amidoxines; azines, e.g., a combination of aliphatic carboxylic acid aryl hydrazides and ascorbic acid; a combination of a polyhydroxybenzene and a hydroxylamine, a reductone and/or a hydrazine; hydroxamic acids; a combination of azines and sulfonamidophenols; α -cyanophenylacetic acid derivatives; a combination of a bis- β -naphthol and a 1,3-dihydroxybenzene derivative; 5-pyrazolones; sulfonamidophenol reducing agents; 2-phenylindane-1,3-dione; chromans; 1,4-dihydropyridines, such as 2,6-dimethoxy-3,5-dicarbethoxy-1,4-dihydropyridine; bisphenols, e.g., bis(2-hydroxy-3-t-butyl-5-methylphenyl)methane, bis(6-hydroxy-m-tolyl) mesitol, 2,2-bis(4-hydroxy-3-

methylphenyl)propane, 4,4-ethylidene-bis(2-t-butyl-6-methylphenol, UV-sensitive ascorbic acid derivatives and 3-pyrazolidones.

[0036] The preferred developers are hindered phenols of the general formula:

in which;

R⁶ represents hydrogen or an alkyl group generally comprising up to 15 carbon atoms, e.g., butyl, 2,4,4-trimethylpentyl, and

R⁷ and R⁸ represent H or alkyl groups of up to 5 carbon atoms, e.g. methyl, ethyl, t-butyl.

[0037] The presence of a toner (sometimes referred to as a "tone modifier") is not essential, but is highly preferred. Examples of suitable toners are disclosed in Research Disclosure No. 17029 and include: imides, e.g., phthalimide; cyclic imides, pyrazolin-5-ones and a quinazolinone, such as succinimide, 3-phenyl-2-pyrazolin-5-one, 1-phenylurazole, quinazoline and 2,4-thiazolidinedione; naphthalimides, e.g., N-hydroxy-1,8-naphthalimide; cobalt complexes, e.g., cobaltic hexammine trifluoroacetate, mercaptans, e.g., 3-mercapto-1,2,4-triazole; N-(aminomethyl)aryl dicarboximides, e.g., N-(dimethylaminomethyl)phthalimide; a combination of blocked pyrazoles, isothiuronium derivatives and certain photobleach agents, e.g., a combination of N,N'-hexamethylene bis(1-carbamoyl-3,5-dimethylpyrazole), 1,8-(3,6-dioxaoctane)bis(isothiuronium trifluoroacetate) and 2-(tribromomethylsulfonyl) benzothiazole; merocyanine dyes, such as 3-ethyl-5-[(3-ethyl-2-benzothiazolinylidene)-1-methylethylidene]-2-thio-2,4-oxazolidinedione; phthalazinone, phthalazinone derivatives or metal salts of these derivatives, such as 4-(1-naphthyl)phthalazinone, 6-chlorophthalazinone, 5,7-dimethoxyphthalazinone and 2,3-dihydro-1,4-phthalazinedione; a combination of phthalazinone and a sulfinic acid derivative, e.g., 6-chlorophthalazinone plus sodium benzene sulfinate or 8-methylphthalazinone plus sodium p-tolylsulfinate; a combination of phthalazinone plus phthalic acid; a combination of phthalazine including an adduct of phthalazine and maleic anhydride) and at least one compound selected from phthalic acid, a 2,3-naphthalene dicarboxylic acid or an o-phenylene acid derivative and anhydrides thereof, e.g., phthalic acid, 4-methylphthalic acid, 4-nitrophthalic acid and tetrachlorophthalic anhydride; quinazolinonediones, benzoxazine and naphthoxazine derivatives; benzoxazine-2,4-diones, e.g., 1,3-benzoxazine-2,4-dione; pyrimidines and asym-triazines, e.g., 2,4-dihydroxypyrimidine, and tetraazapentalene derivatives, e.g., 3,6-dimercapto-1,4-diphenyl-1H,4H-2,3a,5,6a-tetraazapentalene.

[0038] Preferred toners are phthalazinone, phthalazine, 4-methylphthalic acid and phthalic acid, either alone or in combination with other compounds.

[0039] The toner, when present, is generally included in an amount of from 0.2 to 12%, preferably 0.2 to 5% by weight of the imaging layer.

[0040] The photothermographic chemistry is typically applied to the support in a binder. A wide range of binders may be employed in the imaging layer(s), including both natural and synthetic resins. Copolymers and terpolymers are of course included. Suitable binders are transparent or translucent, are generally colourless and include natural polymers, synthetic resins, polymers and copolymers and other film forming media such as: gelatin; gum arabic; poly(vinyl alcohol); cellulose esters, such as hydroxyethyl cellulose, cellulose acetate, cellulose acetate butyrate; poly(vinyl pyrrolidone); casein; starch; poly(acrylic acid), poly(methylmethacrylic acid), poly(methacrylic acid); poly(vinyl chloride); copoly(styrene-maleic anhydride), copoly(styrene-acrylonitrile), copoly(styrene-butadiene); polyacrylonitrile; polyvinyl acetals, such as, poly(vinyl formal) and poly(vinyl butyral); polyesters; polyurethanes; phenoxy resins; poly(vinylidene chloride); polyepoxides; polycarbonates; poly(vinyl acetate); polyolefins, such as poly(ethylene) and poly(propylene), and polyamides. Poly(vinyl acetals), such as poly(vinyl butyral) and poly(vinyl formal), and vinyl copolymers, such as poly(vinyl acetate-chloride) are particularly desirable. The binders are generally used in an amount ranging from 20 to 75% by weight, preferably from 30 to 55% by weight of the silver halide containing layer. The binders may be coated

from aqueous or organic solvents or an emulsion.

[0041] The photothermographic elements of the invention are prepared by simply coating a suitable support or substrate with the one or more imaging layers containing the photothermographic chemistry and, optionally, a oxygen-barrier overlayer. Suitable barrier layers are well known in the art. Each layer is generally coated from a suitable solvent using techniques known in the art. Exemplary supports include materials, such as paper, polyethylene-coated paper, polypropylene-coated paper, parchment and cloth; sheets and foils of metals, such as aluminium, copper, magnesium and zinc; glass and glass coated with metals such as chromium alloys, steel, silver, gold and platinum; synthetic polymeric materials, such as poly(alkyl methacrylates), e.g., poly(methyl methacrylate), polyesters, e.g., poly(ethylene terephthalate) and poly(ethylene naphthalate), poly(vinyl acetals), polyamides, e.g., nylon, cellulose esters, e.g., cellulose nitrate, cellulose acetate, cellulose acetate propionate and cellulose acetate butyrate.

[0042] Various other adjuvants may be added to the photothermographic medium. For example, accelerators, acutance dyes, sensitizers, stabilizers, plasticizers, surfactants, lubricants, coating aids, antifoggants, leuco dyes, chelating agents, binder crosslinking agents, UV-absorbers and various other well-known additives may be usefully incorporated in the medium. The use of acutance dyes matched to the spectral emission of the exposure source is particularly desirable.

[0043] It is not essential for the photothermographic elements of the invention to comprise a separate support since each binder layer, together with the photothermographic chemistry may be cast to form a self-supporting film.

[0044] The supports can be sub-coated with known subbing materials such as: copolymers and terpolymers of vinylidene chloride; and acrylic monomers, such as acrylonitrile and methyl acrylate; unsaturated dicarboxylic acids, such as itaconic or acrylic acid; carboxymethyl cellulose; polyacrylamide, and similar polymeric materials.

[0045] The support can also carry a filter or antihalation layer, such as one comprising a dyed polymer layer, which absorbs the exposing radiation after it passes through the radiation-sensitive layer and eliminates unwanted reflection from the support.

[0046] The invention will now be illustrated by the following Examples.

Example 1

[0047] Preparation of:

Compound A

[0048] A solution of 2-quinolythioacetic acid (6.97g) and sodium hydrogen carbonate (2.73g) in water (70ml) was added slowly to a solution of bromine (13.2ml) and sodium hydroxide (20.85g) in water (560ml) while maintaining a temperature of less than 30°C. After four hours, a precipitate formed that was collected by filtration and dried. This solid was recrystallised from ethanol to yield white needles (5.66g 41%) mp 171-2°C.

Example 2

Skin sensitivity testing

[0049] The compounds of this invention are covered by the general formula of US 3874946 which describes image stabilisers for photothermographic materials but are not exemplified in that patent. A compound that is exemplified in that patent is Compound B which we shall use for comparison of skin sensitising properties with a compound of this invention (Compound A).

Compound B

Procedure for Repeat Insult Human Patch Tests (RIHPT)

[0050] The purpose of this test is to evaluate potential for the induction of allergic contact dermatitis. It is described in detail in: J Stotts, "Planning, conduct and interpretation of human predictive sensitisation patch tests," in Current Concepts in Cutaneous Toxicology (V A Drill and P Lazer, eds), pg 41, Academic Press, New York 1980.

[0051] The RIHPT test determines the responses of human volunteers to induction and challenge patch application of the compound of interest in a coated 'Dry Silver' formulation on paper or PET film. The balance of the formulation has been shown in a separate RIHPT test not to cause contact dermatitis. Induction consists of nine repeated applications (three patches, about one inch square, per week, for approximately 24 hours). Twelve to twenty four days after the final induction application, challenge patches are applied. Allergic contact dermatitis is evaluated primarily from the responses forty eight to ninety six hours after challenge application.

Compound A 0 of >200 persons showed contact dermatitis (not a sensitiser)
Compound B 37 of 211 persons showed contact dermatitis; another 16 were inconclusive.
(comparison) (extreme sensitiser)

Procedure for skin sensitivity tests (guinea-pig)

[0052] The guinea pig maximisation test protocol as described by B Magnusson and A Kligman in Allergic Contact Dermatitis in the Guinea Pig, C C Thomas ed, pgs 11-117 (1970) was used. The compounds were screened for irritation. None of the compounds caused skin irritation to guinea pigs after application as a 25% w/w suspension in petrolatum (mineral oil) for 24 hours.

[0053] A sensitisation test was conducted. For each compound, ten male guinea pigs were assigned to the test group and four male guinea pigs were assigned to the naive control group. On day 1, animals in the test group received duplicate 0.05ml intradermal injections of a 1:1 ratio of Freund's Complete Adjuvant and sterile water on the shoulder area. Six days later, animals in the test group were pretreated with sodium lauryl sulphate applied topically at the injection sites. On day eight, a 25% w/w mixture of the test compound in petrolatum was applied over the injection sites of the animals and occluded for 48 hours. The naive control animals were not treated during the induction phase.

[0054] Two weeks after the topical application, all animals received a challenge dose. A 25% w/w mixture of the test compound in petrolatum was applied to the right flank of test and naive control (previously untreated) animals. All sites were occluded for 24 hours and then wiped clean. Test sites were examined for erythema reactions at 24 and 48 hours after patch removal. In no case was reaction seen in the naive control animals.

Compound A 0 out of 10 animals showed reactions
Compound B 10 out of 10 animals showed moderate to intense dermal reactions (extreme sensitiser)

Example 3

[0055] A series of black and white photothermographic elements were prepared: Silver soap underlayer:

[0056] A silver halide-silver behenate dry soap was prepared by the procedures described in US Patent No. 3,839,049. The silver halide totalled 9% of the total silver while silver behenate comprised 91% of the total silver. The silver halide was a 0.055 μ m silver bromiodide emulsion with 2% iodide.

[0057] A photothermographic emulsion was prepared by homogenising 300g of the above dry soap with 525g of toluene, 1675g 2-butanone and 50g poly(vinylbutyral) (B-76, Monsanto).

[0058] The homogenised photothermographic emulsion (500g) and 100g 2-butanone were cooled to 55°C with stirring. Additional poly(vinylbutyral) (75.7g B-76) was added and stirred for 20 minutes. Pyridinium hydrobromide perbromide.

mide (PHP, 0.45g) was added and stirred for two hours. The addition of 3.25ml of a calcium bromide solution (1g of CaBr_2 and 10ml of methanol) was followed by 30 minutes of stirring. The temperature was raised to 70°C and the following were added in 15 minute increments with stirring: IR dye solution (8.8mg Dye 1 in 7.1g DMF), 4.2g of supersensitiser solution (0.22g 2-mercaptobenzimidazole and 4g methanol) and 16.6g of developer 1,1-bis(2-hydroxy-3,5-dimethylphenyl)-3,5,5-trimethylhexane.

[0059] Topcoat: An active, protective top coat was prepared from the following ingredients;

acetone	256g
methylethylketone	123g
methanol	50g
cellulose acetate	20.2g
phthalazine	2.89g
4-methylphthalic acid	1.55g
tetrachlorophthalic acid	1.01g
tetrachlorophthalic anhydride	1.5g
Compound A (this invention) or Compound C (comparison)	0.125/0.188/0.25/0.312g

[0060] The photothermographic emulsion was coated on 3 mil ($7.6 \times 10^{-5}\text{m}$) polyester base by means of a knife coater and dried at 175°F (80°C) for four minutes. The dry coating weight was 23g per sq m.

[0061] The topcoat solutions were coated over the silver layer at a dry weight of 3.0g per sq m. The layer was dried at 175°F (80°C) for four minutes.

[0062] Once dry the materials were imaged by exposure with a laser sensitometer incorporating a 780nm diode. After exposure, the film strips were processed at 260°F (127°C) for ten seconds. The images obtained were evaluated by a densitometer. Sensitometric results include Dmin, Dmax, speed and contrast. Sensitometry was also evaluated following accelerated aging at 120°F (49°C) and 50% relative humidity for 7 and 14 days. The results are reported in the following Tables.

	Dmin	Dmax	Speed	Contrast
Compound A 0.12g	0.12	3.07	2.72	3.52
Compound A 0.188g	0.12	3.03	2.82	3.56
Compound A 0.250g	0.11	2.97	2.80	3.56

EP 0 631 176 B1

(continued)

	Dmin	Dmax	Speed	Contrast
Compound A 0.312g	0.10	2.94	2.77	3.31
Compound C 0.250g (comparison)	0.10	2.95	2.72	3.52
No Compound	Black	Black		

After aging - 120°F(49°C)/50% RN

[0063]

	7 Days		14 Days	
	Dmin	Dmax	Dmin	Dmax
Compound A 0.125g	0.11	3.14	0.11	3.19
Compound A 0.188g	0.11	3.10	0.11	3.19
Compound A 0.250g	0.10	3.07	0.10	3.13
Compound A 0.312g	0.10	3.05	0.09	3.06
Compound C 0.250g	0.11	3.05	0.10	3.06
No Compound	Black		Black	

Compound C

[0064] Compound C is disclosed in EP-A-0605981 and is shown therein to combine excellent photothermographic properties (better than Compound B) with greatly reduced skin sensitising properties. The photographic properties of compound A of the invention are shown herein to compare favourably with those of Compound C.

Claims

1. A compound having a nucleus of the formula:

2. A compound as claimed in Claim 1 having the general formula:

in which;

each R is independently selected from hydrogen, alkyl of up to 10 carbon atoms, aryl of up to 14 carbon atoms, heterocyclic groups of up to 14 ring atoms, halogen, carboxylic acid, ester, amide, hydroxy and any combination thereof.

3. A compound as claimed in Claim 2 in which each R is hydrogen.
4. A photothermographic element comprising a light-sensitive silver halide in reactive association with a reducible silver compound, a reducing agent capable of reducing the silver compound to metallic silver, and, as antifoggant, a compound as claimed in any preceding Claim.
5. A photothermographic element as claimed in Claim 4 in which the antifoggant compound is present in an amount from 1×10^{-3} to 1×10^{-1} moles per mole of silver halide.
6. A photothermographic element as claimed in any preceding Claim which additionally comprises, as a speed enhancing agent, a hydrobromic acid salt having a central nucleus of the formula:

in which;

Q comprises the atoms necessary to complete a 5, 6, or 7-membered heterocyclic ring nucleus selected from a pyridine, pyrrolidone and pyrrolidinone ring nucleus.

7. A photothermographic element as claimed in Claim 6 in which the hydrobromic acid salt comprises a compound having a central nucleus of a formula selected from:

in which;

n is 0 (zero) or has integral values of from 1 to 4, and

each R^5 is independently selected from hydrogen, alkyl of up to 10 carbon atoms, aryl of up to 14 carbon atoms, heterocyclic groups of up to 14 ring atoms, halogen, carboxylic acid, ester, amide, hydroxy and any combination thereof.

8. A photothermographic element as claimed in Claim 6 or Claim 7 in which the hydrobromic acid salt is pyridinium hydrobromide perbromide.
9. A photothermographic element as claimed in any one of Claims 5 to 8 in which the reducible silver source is the silver salt of behenic acid.
10. A photothermographic element as claimed in any one of Claims 5 to 9 comprising, as a reducing agent for silver ion, a phenidone, hydroquinone, catechol or a hindered phenol having a nucleus of the general formula:

in which;

R^6 represents hydrogen or an alkyl group comprising up to 15 carbon atoms, and R^7 and R^8 independently represent hydrogen or alkyl groups of up to 5 carbon atoms.

11. A photothermographic element as claimed in any one of Claims 5 to 10 in which the reducing agent is used in combination with a toner selected from phthalazinone, phthalazine, phthalic acid and any combination thereof.

Patentansprüche

1. Verbindung mit einem Kern der Formel:

2. Verbindung nach Anspruch 1 der allgemeinen Formel:

worin:

jeder Rest R unabhängig aus einem Wasserstoffatom, einem Alkylrest mit bis zu 10 Kohlenstoffatomen, einem Arylrest mit bis zu 14 Kohlenstoffatomen, einem heterocyclischen Rest mit bis zu 14 Ringatomen, einem Halogenatom, einer Carbonsäure-, Ester-, Amid- oder Hydroxygruppe oder irgendeiner Kombination davon ausgewählt ist.

3. Verbindung nach Anspruch 2, worin jeder Rest R ein Wasserstoffatom ist.
4. Photothermographisches Element umfassend ein lichtempfindliches Silberhalogenid in reaktiver Kombination mit

einer reduzierbaren Silberverbindung, ein Reduktionsmittel, das in der Lage ist, die Silberverbindung zu metallischem Silber zu reduzieren, und als Anti-Schleiermittel eine Verbindung nach einem der vorangehenden Ansprüche.

5. Photothermographisches Element nach Anspruch 4, in welchem das Anti-Schleiermittel in einer Menge von 1×10^{-3} bis 1×10^{-1} Mol pro Mol Silberhalogenid vorhanden ist.
6. Photothermographisches Element nach einem der vorangehenden Ansprüche, das zusätzlich als die Empfindlichkeit verstärkendes Agens ein Salz der Bromwasserstoffsäure mit einem zentralen Kern der Formel

umfaßt, worin :

Q die zur Vervollständigung eines 5-, 6- oder 7-gliedrigen, aus einem Pyridin-, Pyrrolidon- und Pyrrolidinon-ringgerüst ausgewählten heterocyclischen Ringgerüsts notwendigen Atome umfaßt.

7. Photothermographisches Element nach Anspruch 6, worin das Salz der Bromwasserstoffsäure eine Verbindung mit einem zentralen Kern einer aus

ausgewählten Formel umfaßt, worin:

n 0 (Null) oder ein ganzzahliger Wert von 1 bis 4 ist, und
 jeder Rest R_5 unabhängig aus einem Wasserstoffatom, einem Alkylrest mit bis zu 10 Kohlenstoffatomen, einem Arylrest mit bis zu 14 Kohlenstoffatomen, einem heterocyclischen Rest mit bis zu 14 Ringatomen, einem Halogenatom, einer Carbonsäure-, Ester-, Amid- oder Hydroxygruppe oder irgendeiner Kombination davon ausgewählt ist.

8. Photothermographisches Element nach Anspruch 6 oder 7, worin das Salz der Bromwasserstoffsäure Pyridiniumhydrobromidperbromid ist.

9. Photothermographisches Element nach einem der Ansprüche 5 bis 8, in welchem die reduzierbare Silberquelle das Silbersalz der Behensäure ist.

10. Photothermographisches Element nach einem der Ansprüche 5 bis 9, welches als Reduktionsmittel für Silberionen ein Phenidon, ein Hydroquinon, ein Katechol oder ein gehindertes Phenol mit einem Kern der allgemeinen Formel

umfaßt, worin R_6 ein Wasserstoffatom oder einen Alkylrest mit bis zu 15 Kohlenstoffatomen darstellt, und R_7 und R_8 unabhängig ein Wasserstoffatom oder einen Alkylrest mit bis zu 5 Kohlenstoffatomen darstellen.

11. Photothermographisches Element nach einem der Ansprüche 5 bis 10, worin das Reduktionsmittel in Kombination

mit einem Toner, ausgewählt aus Phthalazinon, Phthalazin, Phthalsäure und irgendeiner Kombination davon, verwendet wird.

Revendications

1. Composé ayant un noyau de formule :

2. Composé selon la revendication 1, de formule générale :

dans laquelle :

chaque R est indépendamment choisi parmi l'hydrogène, les radicaux alkyle ayant jusqu'à 10 atomes de carbone, les radicaux aryle ayant jusqu'à 14 atomes de carbone, les groupes hétérocycliques ayant jusqu'à 14 atomes sur le cycle, les halogènes, les acides carboxyliques, les esters, les amides, les radicaux hydroxy et l'une quelconque de leurs combinaisons.

3. Composé selon la revendication 2, dans lequel chaque R est l'hydrogène.
4. Élément photothermographique comprenant un halogénure d'argent photosensible en association réactive avec un composé de l'argent réductible, un agent réducteur capable de réduire le composé de l'argent en argent métallique et, à titre de composé anti-voile, un composé selon l'une quelconque des revendications précédentes.
5. Élément photothermographique selon la revendication 4, dans lequel le composé anti-voile est présent en une quantité de 1×10^{-3} à 1×10^{-1} mole par mole d'halogénure d'argent.
6. Élément photothermographique selon l'une quelconque des revendications précédentes, qui comprend de plus, à titre d'agent augmentant la vitesse, un sel d'acide bromhydrique ayant un noyau central de formule :

dans laquelle :

20 Q comprend les atomes nécessaires pour compléter un noyau hétérocyclique à 5, 6 ou 7 chaînons choisi parmi les noyaux pyridine, pyrrolidone et pyrrolidinone.

7. Élément photothermographique selon la revendication 6, dans lequel le sel d'acide bromhydrique comprend un composé ayant noyau central de formule choisie parmi :

dans laquelle :

n vaut 0 (zéro) ou a des valeurs entières de 1 à 4, et chaque R5 est indépendamment choisi parmi l'hydrogène,

les radicaux alkyle ayant jusqu'à 10 atomes de carbone, les radicaux aryle ayant jusqu'à 14 atomes de carbone, les groupes hétérocycliques ayant jusqu'à 14 atomes sur le cycle, les halogènes, les acides carboxyliques, les esters, les amides, les radicaux hydroxy et l'une quelconque de leurs combinaisons.

8. Élément photothermographique selon la revendication 6 ou la revendication 7, dans lequel le sel d'acide bromhydrique est le perbromure de bromhydrate de pyridinium.
9. Élément photothermographique selon l'une quelconque des revendications 5 à 8, dans lequel la source d'argent réductible est le sel d'argent d'acide béhénique.
10. Élément photothermographique selon l'une quelconque des revendications 5 à 9, comprenant, à titre d'agent réducteur pour l'ion argent, une phénidone, une hydroquinone, un catéchol ou un phénol encombré ayant un noyau de formule générale :

dans laquelle :

R6 représente l'hydrogène ou un groupe alkyle comprenant jusqu'à 15 atomes de carbone, et R7 et R8 représentent indépendamment l'hydrogène ou des groupes alkyle ayant jusqu'à 5 atomes de carbone.

11. Élément photothermographique selon l'une quelconque des revendications 5 à 10, dans lequel l'agent réducteur est utilisé en combinaison avec un toner choisi parmi la phthalaznone, la phthalazine, l'acide phthalique et l'une quelconque de leurs combinaisons.
